

RASAD platform

Wafra Review

Reviewed 30 September 2026 by Romain Bigare, Director of Digital Systems

Giving the six modules a place in the menu

WHAT WE FOUND

The side menu has 8 items. 3 items carry the main work, and 4 are support-related : Raise Ticket, Contact Us, Feedback, and Account and Settings.

The 6 modules named in the contract are reached through cards on the Farm page. Modules have no page of their own, there is no place to show all of their deliverables, and a new user cannot tell from the menu what the platform measures.

WHAT WE SUGGEST

We would give each module its own entry in the menu, with a small group of pages under it. The existing screens keep their place: the Executive View stays at the top, Farm Monitoring becomes the page for one farm, and Reports stays the place for exports. The 4 support items can share one Support entry at the foot of the menu.

Current – 8 items	Suggested breakdown by the 6 modules
SOVEREIGN OPS Executive View Farm Farm Monitoring Reports	Executive View What we have, and where
	Crop Monitoring · Crops and area · Seasonal change · Fallow land
	Tree Monitoring
	Land Use & Structures
	Irrigation Efficiency
	Crop Water Calculator
	Yield Optimisation
	Farm Monitoring One farm
	Reports
	Support · Account

Opening a module shows its pages. The existing screens keep their names.

WHAT GOES IN EACH MODULE

Each module needs 2 or 3 pages to hold its contract deliverables. As a starting point:

What each module measures and shows		
Module	Pages	What is measured and shown
Crop Monitoring	Crops and area	Crop location and type. Cultivated area per farm and per crop, in dunums.
	Seasonal change	New and abandoned cultivation against the same season last year.
	Fallow land	Land ready for cultivation but not planted, per farm. Resting under or over 12 months.
Tree Monitoring	Tree count	Tree location and count. Species and variety: date palm cultivars, fruit, forest trees.
	Canopy health	Canopy Health Index per farm, palms and fruit trees apart. Farms under stress.
	Annual change	New plantings, removals and canopy loss against last year.
Land Use & Structures	Land use	Open and protected agriculture, structures and barren land, as area and share.
	Structures	Count and footprint by type: housing, storage, animal enclosures, utilities.
Irrigation Efficiency	Scores	IER score and band per farm, province averages, farms above the subsidy line of 65.
	Trend	Score by quarter. Farms that improved and farms that fell.
Crop Water Calculator	Monthly demand	Water demand per farm and per crop, in m ³ per dunum. Farms more than 25% over demand.
	Season budget	Water per crop over its growing season, and per kilo harvested.
Yield Optimisation	Yield forecast	Tonnes per dunum per farm and crop. Farms below the crop average. Production by province.
	Crop calendar	When each crop is in the ground, month by month.

Separating the levels of detail

WHAT WE FOUND

The Farm page gathers a lot of useful content: land use, crop and tree shares, the 6 module cards, and a ranking of farms. It is about 5,400 pixels tall, or six screens of scrolling, and it moves between the whole emirate, one farm picked from a menu, and a list of 15 farms. A reader has to work out, block by block, which level each part is about.

The Farm page, top to bottom. Colour shows the level each block talks about.

- Map of the emirate with layers
 - 4 figures for the emirate
 - Water and yield for one farm, picked from a menu
 - Share bars land use, crop type, trees
 - 6 module cards, one number each
 - A detail table for the card that is open
 - 15 farms ranked, as large cards
- Emirate ■ Module ■ One farm

WHAT WE SUGGEST

We would keep the existing screens and give each one a single level of details. The Executive View covers what we track and where. The module pages cover one topic across all farms. Farm Monitoring covers one farm. The work is mostly moving blocks rather than building them, as most of the content can be accommodated in this revised structure.

Where each block of the Farm page goes	
On the Farm page today	Moves to
■ Map, emirate figures, share bars	Executive View
■ 6 module cards and their detail tables	The 6 module pages, one card each, grown into a page
■ Ranking by health, yield, IER and water	Each module's farm table, as sortable rows
■ Water and yield for one farm	Farm Monitoring

Nothing is dropped. Each block moves to the page that matches its level.

A focused Executive View

WHAT WE FOUND

The Executive View opens with the right numbers: how many farms there are, and how much land is farmed or left fallow.

Around those numbers, the page holds a lot more: fields, trees, a tree split, barren land, structures, a tree species table, a canopy health bar, three tabs and a map with its own layer panel. All of it is useful, but we would suggest a reorganisation to improve the user experience. Two small additional thoughts: the dark card at the top pulls the eye away from everything below it, and the filtering tabs sit halfway down on the right, so when you switch tab, the page moves and you lose your place.

The content is good but we would suggest rehomeing it in one of the modules, where it can be the main subject.

The dark header card at the top of the page can pull attention.

The 3 tabs and a map button, halfway down the page on the right.

WHAT WE SUGGEST

One idea is to give the Executive View one question to answer: what do we have, and where? Four figures, one map that counts farms, and two short crop tables are enough for that. Everything else moves to the module that owns it, where it gets more room than it has today. The header card can take the same light style as the rest of the page, and then the tabs are no longer needed.

The crop tables keep one useful habit: each row opens into its crops. This is called drill down. You start with a big group, such as cereals, and go one step deeper to see the crops inside it.

Letting the filters reach every page

WHAT WE FOUND

The header has a region menu / filter, which we find is a great idea. We think it could be enhanced to include filters for crop and tree types. If filters are controlled from the top, the data on the page can be more focused and relevant. Today, share bars and tables always show every type at once.

As an example, today, it would be difficult to answer a question like : how many farms grow tomatoes in Al Ain, and which ones?

The header today: a region menu, coverage labels, search and the language switch.

WHAT WE SUGGEST

One idea is to build on the header you already have. Next to the region menu, a second menu picks crop and tree types. It lists the groups in a fixed order (cereals, fodder, open field, date palm, fruit trees, forest trees), and each group opens into its crops or varieties. It can take the place of the coverage labels.

Both menus would then apply to the whole page. In practice, this means that when someone picks Al Ain and tomatoes, every figure, chart, map and table on the page changes together. There is no apply button. The choice is kept in the page link and stays when the person moves to another page, so the chips on single lists are no longer needed. Summary rows open into their parts, and every farm name opens the farm.

3 clicks answer the tomato question, from any page.

Adding trend data

WHAT WE FOUND

Every number describes what is happening today, and the figures are clear and easy to read. What is missing is the story over time. No figure says whether it went up or down since last quarter or last year. There is no chart over time, and no list of the farms that changed.

For our governmental clients, the trend is often the most important. The ADAFSA deliverables names a seasonal change report, annual tree change and a quarterly irrigation trend, so this fits what is already expected.

4 figures for a farm, with no sense of direction.

WHAT WE SUGGEST

We think every module page could get a Change view, as a page or a tab. It has a chart over time, the biggest movers, and the farms behind the movement, from oldest to newest. Crops, irrigation and yield use 6 quarters. This is the shortest window that gives both a last-quarter and a last-year reading. Trees and structures use 3 years, because they change slowly. Change pages have no map. If there is not yet enough history, the page says so in plain words.

The farm table runs oldest to newest, like the chart, and sorts to find who stopped or started. Figures are for illustration.

Writing the farm page for an inspector

WHAT WE FOUND

Farm Monitoring brings a lot together for one farm: health, yield, irrigation, water and a field table. That is a good base. The page opens on satellite codes (S1, S2, S3), cloud cover to two decimals, pass times to the second, and NDVI, NDWI and SAVI switches. These help a specialist, but we wonder if an inspector who is preparing a visit would want simpler things at-a-glance: what the farm grows, how it is doing, and what to check. Today these are hard to find in plain words.

The farm cards also give instructions to the farmer, such as "Increase pivot delivery by 12% between 19:00 and 04:00". Watering times, soil salinity and weather belong in the farmer's own app. The contract presents these modules without prescriptive irrigation advice, so we think it is enough to tell the inspector what is currently happening.

The first thing a user reads about a farm: satellite passes and cloud cover.

WHAT WE SUGGEST

One idea is to keep the page and change the order. It would open on a plain profile: the 4 figures already there, what the farm grows, its trees, and what changed since last quarter. A second tab lists what to check on a visit. These are neutral findings, with the most important first, and a print button. The satellite strip, the indices and the field table move to a third tab, Satellite detail, for the specialists who need them. Nothing is lost. We just move it one level deeper.

Findings say what is true and what to look at. They do not tell the farmer how to water.

Aligning the scores with the contract

WHAT WE FOUND

We think our scores must use one scale everywhere. If it does not, the same farm can get two different verdicts. Today, irrigation efficiency is shown in 4 bands: Excellent, Good, Moderate and Low, so a farm at 78 shows as Good. The deliverables for ADAFSA calls the same farm Acceptable. Canopy health is an NDVI percentage. Water is flagged as overdraft as soon as the balance goes below zero. The deliverables define all 3 differently.

"Canopy health (NDVI)" and one-word labels on the ranking cards.

WHAT WE SUGGEST

We would want to define each score once and let every screen read that one definition: the name, the band edges, the words and the colours.

Irrigation efficiency gets 5 bands: Excellent 90–100, Good 80–89, Acceptable 65–79, Poor 50–64 and Critical below 50. A line at 65 marks the subsidy, with a list of the farms on each side. The Canopy Health Index gets one number per farm, worked out separately for palms and for fruit trees. Over-allocation means a farm uses more than 25% above crop demand. It is flagged each month and broken down by crop, to show where the water goes.

Each scale is kept in one place in the code. Every page, table and export reads it from there.

A calmer visual language

WHAT WE FOUND

The product has a clear identity: the ADAFSA lockup, a bilingual name and a steady green. On a single screen, though, we count green, teal, blue, orange, yellow, purple and red, often with no meaning. The small caption under each figure, for example, has its own colour. Dark teal headers sit next to white cards. Almost every number is in a coloured pill, every section opens with an icon in a tinted square, and many labels are capitals at 9 or 10 pixels.

Titles are relatively long and abstract, and some lines make claims that nothing on screen supports. The result can feel a little overwhelming, the product feels busier than it is.

A section title, and a status line in the menu.

WHAT WE SUGGEST

One idea is a short set of rules that every screen follows. It would help getting a quieter design. The rules are a starting point, and the second table shows how the long titles could become plain names.

Page	White cards on light grey. One header style.	Today	Suggested
Colour	Grey text. One green for actions and selection.	Farm-Specific Water Demand & Sovereign Yield Telemetry	Water and yield
Status	The 5-step ramp, only where something is judged. 	Farm Performance & Agronomic Ranking Intelligence	Farm ranking
Crop groups	One colour each, in a fixed order. 	Operations Domain & Interactive Deep Dives	Land use
Type	One font. 12 px at least. Sentence case.	Sovereign Agricultural Reports & Telemetry Audits	Reports
Pills	For a status only. Icons in the menu only.	System Sync: Connected	Data as of 22 Sep 2026
Unit	Dunum everywhere. Hectares in the export.	100% Boundary Verified	remove
		18,442 RPW Bio-Acoustic Sensors Active	remove

Name the thing plainly. Keep a claim on screen only if someone can explain it, and give it a date.

Working from a common page frame

So far, each screen has been designed on its own, so each has its own layout, its own boxes and its own colours. One idea is to place every page in a common page frame. The frame is the set of parts that every page shares: a top bar, a menu on the left, a line that says what you are looking at, and the same blocks for the content. This settles most of the 8 points above at once, and it makes each new page cheaper to build. Part of the frame already exists: the header holds the region menu, the search box, the English and Arabic switch and the account, and the Reports page is the natural home for exports.

The pages keep their content and gain a shared shape. Figures are for illustration.

The frame has 4 parts. The top bar holds what stays true everywhere: the region and the crop menus side by side, one search box for farms, the language switch and the account. A choice made there stays when somebody moves between pages.

The rail on the left holds the Executive View, the 6 modules, Farm Monitoring and Reports, with Support at the foot, as described in point One.

A context line sits under the bar on every page. It repeats the selection and gives the number of farms, the area and the date of the data, so somebody always knows what they are looking at and how fresh it is.

The page itself follows the same 3 blocks every time: a strip of figures, a chart or a map, and a table. Once those exist, a new module is a set of figures, one chart and one table, rather than another page to design. Because the frame is one piece, it also turns right-to-left for Arabic as one piece. We are happy to help with any of these points as you go.
